Harbourmaster's Direction

Every vessel that intends to navigate in the Marlborough Harbour with a pilot on board must ensure that prior to entering the harbour limits or departing the berth, the vessel's primary means of navigation, ECDIS or paper chart, shows the exact waypoints, courses and routes as provided by the Port Marlborough Pilots and (which has been) based upon the Marlborough Common Passage Plan (MCPP).

Every vessel that intends to navigate in the Marlborough Harbour under the conduct of a person holding a Pilotage Exemption Certificate must ensure that prior to entering harbour limits or departing the berth, the vessel's primary means of navigation, ECDIS or paper chart shows the exact waypoints , courses and routes intended to be followed and as provided to the Harbourmaster, and (which has been) based on the Marlborough Common Passage Plan (MCPP).

<https://www.marlborough.govt.nz/environment/harbours/harbour-notice>

Disclaimer: The MCPP is published for reference purposes only. The Marlborough District Council, its agents, instrumentalities, officers, and employees do not guarantee or accept any legal liability arising from, or connected to, the accuracy, reliability, currency, or completeness of any material contained in the MCPP. Seafarers should use the information provided in the MCPP to support voyage (passage) planning, the principles of navigation and the usual practices of seamanship.

Purpose

The Marlborough Common Passage Plan (MCP) is a document produced and issued by the Marlborough District Council (MDC) which seeks to improve pre-pilotage communications between pilots, the holders of pilotage exemption certificates and the vessels they service. The MCP helps to prepare vessels for transits of the pilotage areas described in Maritime Rule Part 90.

The MCP improves the readiness of vessels transiting pilotage areas within the Marlborough Sounds ensuring that voyage plans, waypoints and other planning considerations have been completed in a standardised manner. The MCP seeks to achieve consistency across vessels by ensuring that vessels arrive at pilot boarding grounds (PBG) or pilotage limits and depart berths in a state that is standardised, predictable and well informed. It also seeks to improve water space management and situational awareness between piloted and non-piloted vessels within the Marlborough Sounds.

Area of Operations

The MCP covers pilotage routes to and from Picton Harbour and Waimahara Wharf, via the Tory Channel / Kura Te Au and Northern Entrance options. It also includes fringe routes to and from the most commonly used commercial ship anchorages surrounding the Picton and Waimahara entry and departure routes. A more comprehensive set of route and manoeuvring plans for vessels serviced by the Port Marlborough Pilots (non-ferry traffic) is provided at:
[https:// www.portmarlborough.co.nz/port-information/](https://www.portmarlborough.co.nz/port-information/)

Standard Routes

The routes published in this document contain traditional waypoint, course and distance information based on the WGS-84 datum. Where possible, inbound, and outbound routes are separated (non-reciprocal routes) to accommodate meeting situations. A normal operating “corridor” is also provided in the chartlets; this corridor defines the water space that vessels typically consume whilst following the standard routes. Note that the corridor is a swept path and not XTD corridor. Individual vessels should establish their own turn radius and XTD limits such that the vessel’s swept path is retained within the route corridors under normal operating conditions.

Planning Chartlets

The planning chartlets are not to be used for navigation and are provided for planning purposes only. The turn radius used in all chartlets is 0.5nm at all waypoints. However, individual vessels should establish their own turn radius and XTD limits to reflect their unique operating circumstances. Sample swept path plots have been provided on the chartlets to illustrate how vessels have historically managed to adhere to the corridor under normal operating conditions.

Manoeuvring Plans

The MCPP does not prescribe manoeuvring plans for berthing, unberthing and other close-quarters manoeuvres. Masters are required to have produced accurate manoeuvring plans as part of their voyage plans. This is to enable Pilots, Masters, Bridge Teams, and Tug Masters to have a shared mental model of both the anticipated arrival/departure manoeuvre and berthing manoeuvre to be conducted.

Transit Monitoring

The Marlborough District Council has adopted AIS software technology that pro-actively monitors all piloted and pilot exempt vessels within the area of operations. This technology compares all completed pilotage “transits” against the MCPP routes contained within this document to:

- validate whether the MCPP is feasible and working as intended,
- identify trends, patterns, and metrics relating to navigational performance and risk,
- identify transits of significant interest for potential follow-up action and
- provide input into navigational and operational risk assessment projects.

Safety Margins

The standard routes and planning chartlets define swept path corridors; this is the water space that is expected to be used by piloted and pilot exempt vessels under normal operating conditions. Beyond the corridors are the safety margin areas where vessels may enter for any number of reasons during a passage. These safety margins provide a buffer zone between the safe operating corridor and unsafe no-go zones. In this document the safety margins have been extended (drawn) to the charted 10m contour, however, individual Masters are to determine their own no-go zone limits depending on vessel condition and other pilotage considerations. The MDC's transit monitoring technology detects when safety margins are used and collates statistics to validate (and if necessary, amend) the corridor and safety margin dimensions to reflect normal operating practice. This ongoing process of monitoring and quantification provides valuable input into determining the overall navigational risk in the area of operations.

Statistics

Any transit that consumes more than 50m or 50% of the available safety margin (whichever is lesser) will be identified as an "exceedance" and inspected more closely by the MDC. Exceedance trends, patterns and metrics are collated by the MDC in order to pro-actively manage navigational risk within the area of operations. Such metrics may help to identify specific regions within the area of operations where:

- the corridor is too restrictive; more sea room may be required by piloted and pilot exempt vessels under normal operating conditions,
- there is greater risk of vessels straying beyond the corridors due to navigational difficulty or complexity and/or
- adverse meteorological conditions (e.g. strong tidal flows or strong winds) increase navigational risk and suggest that operating thresholds need to be considered.

The MDC may seek input and feedback from industry in order to understand the underlying reasons for specific exceedance events (or patterns) such that continuous navigational improvement within the area of operations is possible.

Commenting on the Plan

The MCPP is a dynamic living document that the MDC intends to review and update on a regular basis. As such, industry feedback and suggestions for improvement are encouraged and welcomed. Comments on the MCPP should be addressed to the Harbourmaster by email to:

Harbours@marlborough.govt.nz

The Harbourmaster will address all comments raised directly with the person concerned and with the Shipping Company or Port Company, as appropriate. The Harbourmaster will treat any comments with confidentiality if requested.

Additional Resources

The Marlborough District Council website contains links to MCPP route files and associated monitoring polygons that can be downloaded and imported into ECDIS and other GIS applications. See: <https://www.portmarlborough.co.nz/port-information/> for more information.

Standard Routes

1. Tory Channel/Kura Te Au to Picton Harbour

Name	Latitude	Longitude	Course	Distance
Jordy Rocks In	41°13.81'S	174°20.75'E	312°T	2.00NM
West Head In	41°12.48'S	174°18.77'E	243°T	1.57NM
